Prime membership - free/fast shipping, video, music perks  
Returns & refunds center - manage returns from your orders  
Payment methods - manage cards, gift cards, Amazon pay  
Account settings - addresses, order history, subscriptions  
(Subscribe & Save)

2A) return 0 - Signals the program finished successfully, with no errors.  
return 1 - Signals the program finished with an error / failure. Different non-zero codes can represent different error types.

main returns to who? - the operating system (technically the shell / Process that launched the program). That exit code is how the OS or calling script knows whether your program succeeded or failed  
Eg - in a shell script you can check in with  
\$?(Linux/Mac) or %errorlevel% (Windows).
